

CASE STUDY 07

Global Fashion & Lifestyle Brand

Centralizing Global Sourcing Operations with Intelligent Digital File Management

INDUSTRY	ENGAGEMENT	FOCUS AREAS
Retail & Luxury Goods	Direct Engagement	SharePoint Power Platform Automation

THE CHALLENGE

A global fashion and lifestyle brand with sourcing operations spanning APAC, EMEA, and North America needed to modernize how its teams manage sourcing documents. Hundreds of external factory partners regularly exchanged PDF files—tech packs, compliance certificates, shipping documents—through fragmented channels with no standardized naming, storage, or retention policies.

Internal sourcing teams lacked a unified view of documents across regions. Files were scattered across email threads, local drives, and ad-hoc shared folders.

Factory onboarding was manual, file retrieval was time-consuming, and there was no automated mechanism to enforce document retention or generate operational reports.

The product lines behind every tech pack, certificate, and shipping file.

THE APPROACH

We designed and delivered a centralized, region-based digital file storage platform built on Microsoft SharePoint Online, Power Pages, and Power Automate—providing structured document management with self-service portals for both internal users and external factory partners.

SharePoint Site Architecture & Taxonomy

We reviewed and guided the setup of a hierarchical SharePoint structure with regional subsites for APAC, EMEA, and NA. Within each subsite, a four-level folder taxonomy organizes documents by merchandise category, product type, factory, and season—ensuring every file lands in a predictable, auditable location.

SharePoint, Power Pages, and Power Automate doing the heavy lifting.

Master Data Configuration

We configured SharePoint lists to manage reference data including factory profiles, season codes, upload records, and retention policies. These master lists serve as the backbone for automated folder creation, file routing, and lifecycle management across all regions.

Internal Factory Management Portal

Using Power Pages, we built an internal portal enabling sourcing users to onboard, modify, and remove factory profiles. Each action triggers automated workflows that create the corresponding folder structures in SharePoint and maintain factory authentication records in Dataverse.

External Factory Upload Portal

We developed a secure, external-facing portal where factory users authenticate using their credentials and upload sourcing documents with required metadata—merchandise organization, category, season, style number, and first ex-factory date. The system automatically renames files following a standardized convention and routes them to the correct SharePoint location.

Automated Workflows

Power Automate flows handle the heavy lifting: factory folder provisioning, intelligent file renaming and routing, monthly upload reporting broken down by merchandise category, and retention-based housekeeping that automatically archives and removes expired documents based on configurable retention periods.

Regional Reuse Architecture

The entire solution—portals, workflows, and configurations—was built once targeting the APAC subsite and designed for seamless replication across EMEA and NA with minimal parameter adjustments, dramatically reducing deployment effort for subsequent regions.

THE IMPACT

3 Regions Unified document management across APAC, EMEA & NA	100% Automated File naming, routing & folder creation with zero manual effort
Self-Service Factory partners upload documents independently via secure portal	Build Once, Deploy 3× Reusable architecture across all regional subsites

The platform replaced fragmented, email-driven document exchange with a structured, automated system—giving sourcing teams instant access to the right files, in the right place, with full lifecycle governance.
