

CASE STUDY 06

Global Luxury Brand

Building a Vision-Enabled AI Assistant for Brand Intelligence

INDUSTRY	ENGAGEMENT	FOCUS AREAS
Retail & Luxury Goods	Direct Engagement	AI/ML Computer Vision Knowledge Mgmt

THE CHALLENGE

A prestigious global luxury brand sought to democratize access to brand and market intelligence. Their internal insights team maintained a wealth of research—trend reports, competitor analyses, customer sentiment data—that could drive better decision-making across merchandising, marketing, and retail operations.

The client initially explored Microsoft Copilot Studio as the foundation for a conversational AI assistant. However, a critical limitation emerged: luxury brand research is inherently visual. Reports are dense with product imagery, trend boards, and visual analyses that convey meaning no text summary can capture. Out-of-the-box, Copilot Studio struggled to interpret these visual elements.

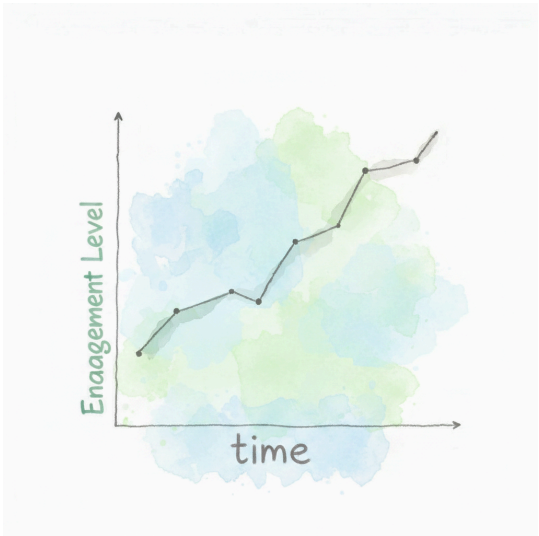

The brand needed an AI assistant that could truly *see* and understand their research—not just read it.

THE APPROACH

We architected and delivered a custom Retrieval-Augmented Generation (RAG) solution with multimodal capabilities.

Multimodal Document Processing Pipeline

We built a sophisticated ingestion pipeline that processes research documents holistically. Text is extracted and chunked for semantic search, while charts, graphs, and visualizations are processed through computer vision models that generate rich descriptions of visual content.

The kind of visual insight the assistant can explain in plain language.

Azure AI Search with Vision-Enhanced Indexing

All processed content—text chunks and visual descriptions alike—flows into Azure AI Search, creating a unified knowledge index that retrieves context from both textual and visual sources.

Vision-Capable Language Model Integration

For response generation, we integrated vision-capable models that can reference and reason about visual content. When a user asks about market trends, the assistant draws insights from chart analyses, explains visualizations, and synthesizes findings across multiple reports.

Seamless Conversational Interface

The final solution delivers a natural chat experience where users can ask complex questions like “What are the emerging color trends for next season based on our competitor analysis?” and receive answers incorporating insights from both written analysis and supporting visualizations.

THE IMPACT

OUTCOME	RESULT
Query Accuracy	High-fidelity responses incorporating visual data insights
Time Savings	Analysts access intelligence in seconds vs. hours
Knowledge Utilization	Previously underutilized visual research now discoverable
Scalability	Self-service access reduces demand on insights team
Decision Quality	Faster, data-informed decisions across the organization

The solution unlocked the full value of the brand's research library—transforming static reports into an interactive, queryable intelligence asset.

TECHNOLOGY STACK

Custom RAG architecture • Azure AI Search • Vision-capable LLMs • Computer Vision document processing • Multimodal embeddings
