

CASE STUDY 05

Global Luxury Brand

Transforming Security Operations Through Intelligent Case Automation

Security Ops Automation AI/ML

THE CHALLENGE

For a prestigious global luxury brand, protecting the business from security threats requires constant vigilance. The security operations team relied on email-based alerts generated by existing filtering rules—a system that successfully flagged unusual activities but produced a significant volume of false positives.

Security officers faced a daily deluge of alerts arriving in their inboxes. Each case demanded manual investigation: reading through email threads, cross-referencing historical incidents, and determining whether the alert warranted action. Critical alerts risked being buried in overflowing inboxes, and institutional knowledge remained trapped in scattered email chains.

THE APPROACH

We designed and implemented an intelligent security case management platform that transforms raw alerts into actionable intelligence.

Automated Alert Ingestion & Enrichment

Using Microsoft Power Automate, we built integration pipelines that capture alerts from the existing email filtering system and ingest them into Microsoft Dataverse. Each alert is automatically enriched with contextual data, creating structured case records.

Machine Learning Classification

Rather than treating every alert equally, we implemented ML models that analyze each case against historical patterns. The system learns from officer feedback, continuously improving its ability to distinguish genuine threats from false positives.

Real-Time Teams Integration

Security officers now receive intelligent notifications directly in Microsoft Teams. Each alert card includes case summary, risk assessment, and one-click action buttons—enabling officers to flag, escalate, or dismiss cases without leaving their workflow.

Conversational Intelligence with Copilot Studio

We deployed a custom Copilot Studio agent that enables security teams to query historical cases through natural conversation. Officers can ask questions like “Show me similar cases from this user in the past 6 months”—surfacing insights that previously required hours of email archaeology.

Unified Analytics & Continuous Improvement

With all case data consolidated in Dataverse, we delivered Power BI dashboards providing real-time visibility into alert volumes, response times, and team performance. The unified data layer enables continuous refinement of ML models.

THE IMPACT

Hours → Minutes

Response time with Teams-based triage

Unified Data

All historical cases searchable via AI

Continuous Learning

ML improvement based on officer feedback

Full Visibility

Real-time dashboards for leadership

The platform transformed security operations from reactive email monitoring to proactive, intelligence-driven threat management.
